Techwondoe: Data Engineer Internship Assignment:

The task is to create an AI engine that can analyze a survey of 10-15 questions submitted by 10 individuals which can read through those Q&As and provide a contextual summary. The engine should also be able to identify where things are lacking or are working great.

It should also suggest improvements and provide some recommendations. (Optional)

The AI model should be trainable and fine-tunable to cater to the specific domain of the survey, such as sales analysis, to provide feedback in a relevant language.

(e.g. if the survey is sales analysis focused, the AI should give feedback in more sales kind of language).

It is also required to observe any differences in the results after retraining the model.
